

Network Topologies

Dr. Miguel Angel León Chávez

Network topologies

MALCH

1

Introduction

- Classification
 - Transmission technology
 - broadcast
 - multicast
 - point-to-point

Network topologies

MALCH

2

Introduction

- Classification
 - Distance among processors
 - data flow machines 0.001 m
 - multicomputers 0.01 m
 - Near Field Communications 0.1 m
 - Body Area Network (BAN) 2 m
 - Personal Area Networks (PAN) 10 m
 - Local Area Networks (LAN) 1 km
 - Metropolitan Area Networks (MAN) 10 km
 - Wide Area Networks (WAN) 1000 km
 - Internet 10 000 km
 - Wired and Wireless

Network topologies

MALCH

3

Topology

- Bus
- Ring
- Star
- Nested

Network topologies

MALCH

4

Bus

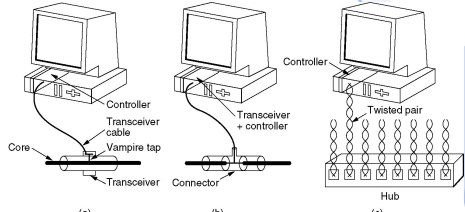

- Characteristics
 - Signal **broadcasted** to all the nodes
 - Several simultaneous senders → collision
 - All nodes receive simultaneously except by the propagation delay

Network topologies MALCH 5

Ethernet Cabling [2]

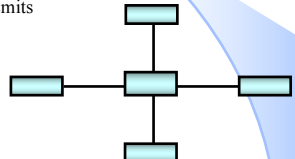

Three kinds of Ethernet cabling
(a) 10Base5, (b) 10Base2, (c) 10Base-T.

Network topologies MALCH 6

Star

- Characteristics
 - One central node
 - It receives and transmits

Network topologies MALCH 7

Star

- Characteristics
 - Central node
 - Active star
 - The central node receives and sends the messages to the destination address (store and forward)
 - Passive star
 - All the messages are physically broadcasted to all the destination

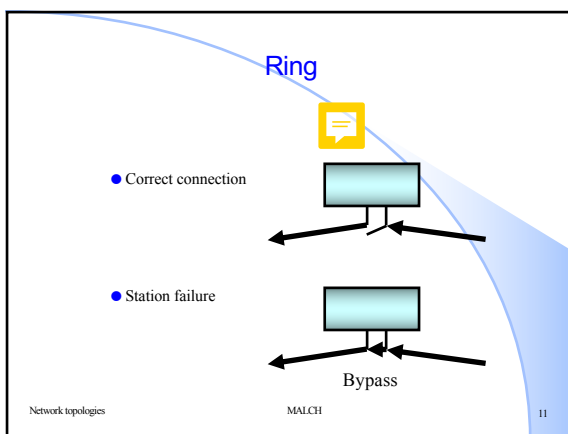

Network topologies MALCH 8

Ring

- Characteristics
 - All the nodes are connected point to point
 - There is a Token
 - The node having the Token has the right to transmit the frames
 - After a token holding time, the node must transmit the Token to the next node in the ring

Network topologies MALCH 9

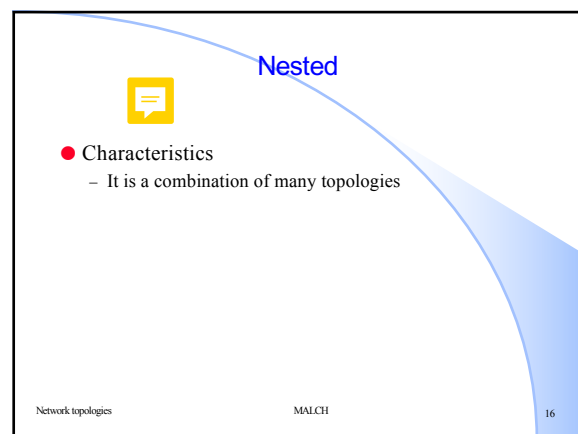

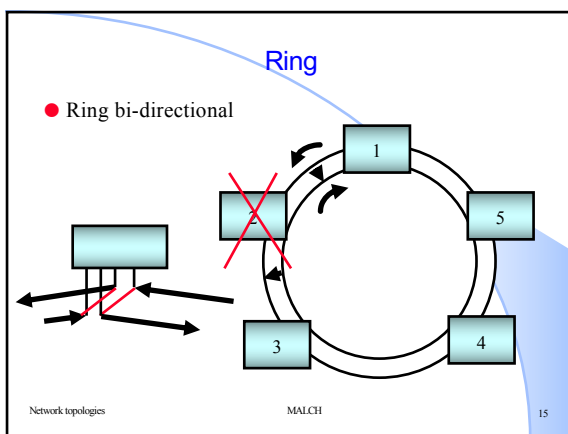

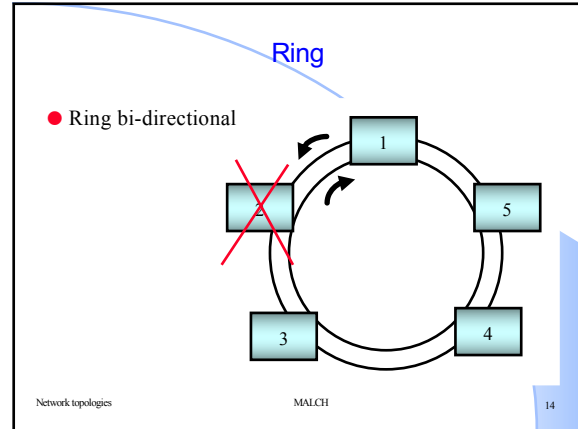

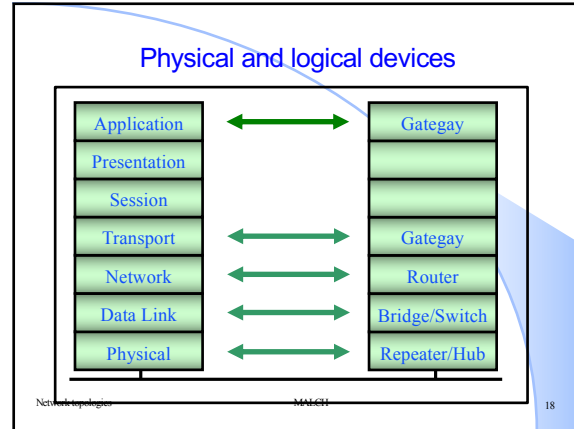

Ring

- Characteristics
 - A frame is partially and temporary stored in each node
 - Each node receives and retransmits the frame
 - A frame may turn indefinitely, the sending node must remove it of the ring
 - Distance between stations increases with station failures

Network topologies MALCH 12

Repeater/Amplifier

- Repeater
 - to increase the digital signal strength
- Amplifier
 - to increase the analog signal strength

Network topologies MALCH 19

Hub

- It acts as a repeater
- When a node transmits the Hub retransmits to all connected nodes (**one to all**)
- However, if two nodes transmit at the same time there will be a collision

Network topologies MALCH 20

Bridge

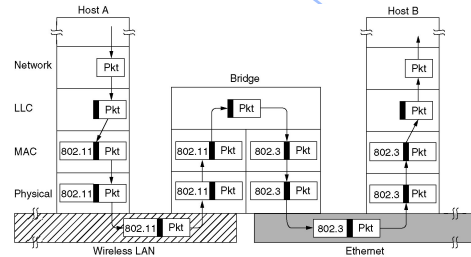

- It allows to interconnect two local area networks (LAN) with the same profile
 - With the same protocols at the physical layer, MAC and LLC sublayers
- It allows to interconnect two LANs with different profiles
 - at the physical layer and MAC sublayer
 - e.g. IEEE 802.3 and IEEE 802.11

Network topologies

MALCH

21

Bridge [1]

Network topologies

MALCH

22

Switch

- It allows to interconnect two or more LANs
- It acts as a switch (on, off) based on **MAC address**
- It receives a frame, analyzes the MAC address, and then retransmits it only to the appropriate destination

Network topologies

MALCH

23

Router

- It allows to interconnect two or more networks
- It stores and forwards an incoming packet to its destination based on the **IP address**
- It is a physical device that defines only the following layers:
 - Network
 - Data link
 - Physical

Network topologies

MALCH

24

Gateway

- It is a logical device (software implementation)
- It acts as a Bridge at the:
 - Transport layer
 - Application layer
- It allows to interconnect two nodes with different:
 - Transport protocols
 - Application protocols
